TOYOTA

Toyota keys from "M" registration onwards have a built in immobilizer which is situated in the head of the key in the form of a transponder chip, this has to be synchronized with the ECU (engine control unit) unlike most other vehicles with this type of security system new or replacement keys cannot be added with specialist equipment in the traditional method and require the ECU to be removed and re-programmed with the information (coding) from the new key(s)

The Main dealer on the other hand will change the lockset and ignition as well as the complete engine management system at a quite frightening cost in some instances

We can carry out the replacement of lost keys as well as erasing any old keys on the system at a much reduced rate without the need to have the vehicle taken to a main dealer and lost for days at a time whilst the work is carried out

Please call for a quote or any if any information is required
